PRESS RELEASE

High performance wind turbine launches at Ecobuild

The new 'nova-wind 6' delivers far greater performance and reliability than existing 6kW wind turbines, but for a similar installed price.

Aimed at smaller commercial applications and larger private properties, the 'nova-wind 6' produces an un-rivalled 15 Megawatts output each year at sites with a wind speed of 6 metres per second, and over 11 Megawatts for sites rated at 5 metres per second.

That's almost **20%** more power output than other 6kW models on sale in the UK.

The new turbine is made in Cologne by RLE International; RLE provide high quality engineering and development services to many global automotive companies.

Combining the latest developments in automotive technology with quality tools and production processes 'nova-wind' deliver the precision engineering and outstanding performance we have come to expect from such top end German manufacturers.

"It is by far the best designed, best built and best performing turbine in this class" said Chris Goodings, Managing Director of UK distributor Solar Energy Alliance; and they should know, with 25 years of wind turbine experience and over 100 similar units installed in the past decade.

"Some of the developments in the Nova-Wind 6kW are elegant in their simplicity, others are technologically state of the art" continued Mr. Goodings, "and the build quality is genuinely outstanding – it really does set a new standard in small wind turbine design."

RESPONSIBLE ENERGY

The Nova-Wind requires much less maintenance than existing turbines, and that provides real cost savings. For a similar installed price the Nova-Wind delivers better annual returns, and these really stack up over the life of the unit.

“Eco-Build was the ideal platform to present this new turbine to the UK market – enabling us to meet with potential clients, business contacts and trade press all in one place – it is an ideal setting for such an important product launch”.
